Class09: Structural Bioinformatics

Yipeng Li

PDB statistics

The PDB is the main database for structural information on biomolecules. Let's see what it contains.

Download a CSV file from the PDB site (accessible from "Analyze" > "PDB Statistics" > "by Experimental Method and Molecular Type". Move this CSV file into your RStudio project and use it to answer the following questions:

```
db <- read.csv("Data Export Summary.csv", row.names = 1)
db
```

	X.ray	EM	NMR	Multiple.methods	Neutron	Other
Protein (only)	154,766	10,155	12,187	191	72	32
Protein/Oligosaccharide	9,083	1,802	32	7	1	0
Protein/NA	8,110	3,176	283	6	0	0
Nucleic acid (only)	2,664	94	1,450	12	2	1
Other	163	9	32	0	0	0
Oligosaccharide (only)	11	0	6	1	0	4

	Total
Protein (only)	177,403
Protein/Oligosaccharide	10,925
Protein/NA	11,575
Nucleic acid (only)	4,223
Other	204
Oligosaccharide (only)	22

> Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

```
sum_comma <- function(x) {
  #substitute the comma and voncert to numeric
  sum(as.numeric(gsub(",","", x)))
}
```

For X-ray

```
#Thus the percentage of X-ray is
round(sum_comma(db$X.ray) / sum_comma(db$Total),2)
```

```
[1] 0.86
```

For EM

```
#The percentage of EM
round(sum_comma(db$EM) / sum_comma(db$Total),2)
```

```
[1] 0.07
```

> Q2: What proportion of structures in the PDB are protein?

```
round(sum_comma(db$Total[1])/sum_comma(db$Total),2)
```

```
[1] 0.87
```

> Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

SKIPPED!

> Q6: Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document.

> Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

The structure is too low a resolution to see H atoms. You need a sub 1 Angstrom resolution to see Hydrogen.

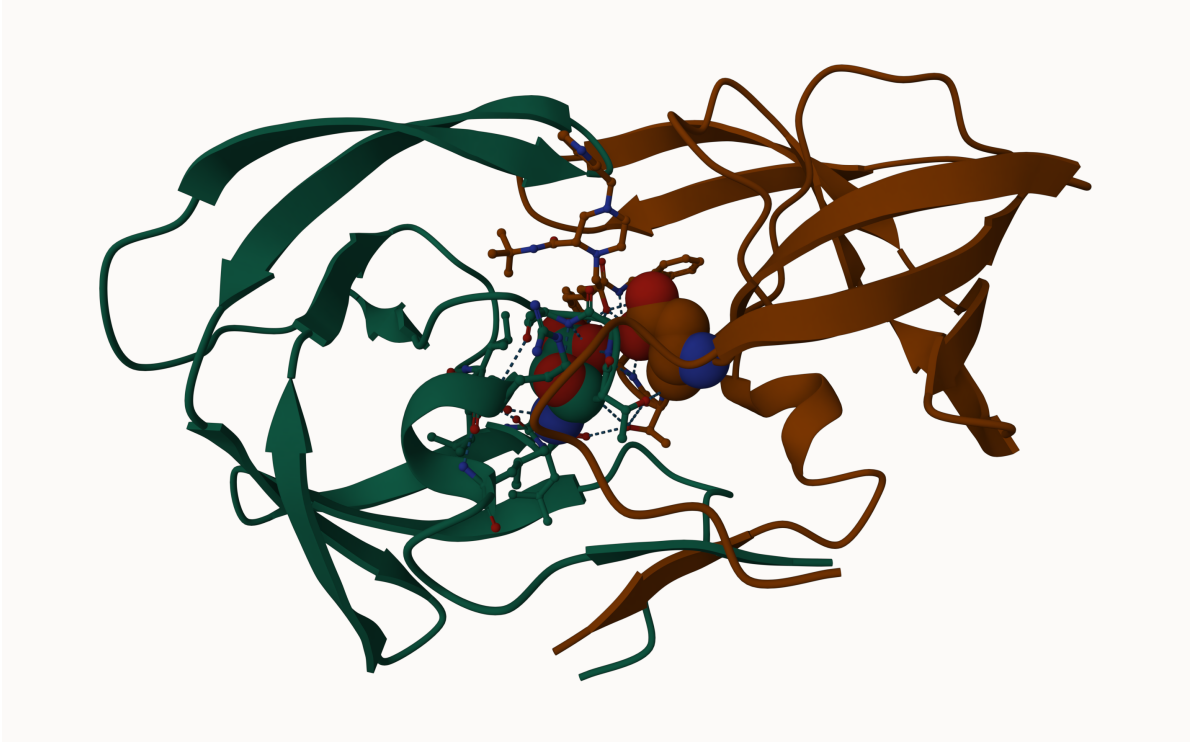

Figure 1: HIV-PR structure from MERK with a bound drug

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

HOH308

Working with Structures in R

We can use the `bio3d` package to read and perform bioinformatics calculations on PDB structures

```
library(bio3d)

pdb <- read.pdb("1hsg")
```

```
 Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")

   Total Models#: 1
     Total Atoms#: 1686,  XYZs#: 5058  Chains#: 2  (values: A B)

     Protein Atoms#: 1514  (residues/Calpha atoms#: 198)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 172  (residues: 128)
     Non-protein/nucleic resid values: [ HOH (127), MK1 (1) ]

      VNIIGRNLLTQIGCTLNF

+ attr: atom, xyz, seqres, helix, sheet,
         calpha, remark, call
```

Q7: How many amino acid residues are there in this pdb object?

198

Q8: Name one of the two non-protein residues?

HOH (127), MK1 (1)

Q9: How many protein chains are in this structure?

2

```
attributes(pdb)
```

```

Read an ADK structure

```
adk <- read.pdb("6s36")
```

```
  Note: Accessing on-line PDB file
   PDB has ALT records, taking A only, rm.alt=TRUE
```

```
adk
```

```
 Call:  read.pdb(file = "6s36")
